

About Query Management

Type: User Documentation 21-Nov-2023 | Siri Benedicte Dahle

Query management is a digital work process for queries from site to Project Engineering. Query Management is used by Construction and Commissioning to raise Site Queries to Project Engineering og follow-on Engineering during project execution. The module provides real-time tracking of queries and ensures that all parties are aware of their status. This helps to reduce the time taken to resolve queries, minimizes the risk of delays and cost overruns, and improves the overall project management process.
